

Setup Sheet Application by Texono

Modern machine shops need more than manual paperwork and disconnected spreadsheets to manage CNC setup efficiently. Texono provides a Setup Sheet Application designed to simplify this process and give shop floors better control over every job.

The [Setup Sheet Application](#) is a custom web app built specifically for CNC machine shops, covering lathes, milling machines, drills, and other equipment. The system automatically generates digital setup sheets for each job, pulling tooling requirements, cutting parameters, workpiece positioning, and step-by-step instructions from existing shop databases instead of relying on manual notes or outdated documents.

Texono also integrates the Setup Sheet Application with its Tool Crib Application, keeping tooling information, inventory, and offsets synchronized automatically across the shop. Instead of forcing operators to work around scattered paperwork and inconsistent processes, the application is built around how machine shops actually run their day-to-day setups, helping teams reduce setup time, minimize errors, and maintain consistency across operators and shifts.
